# WHAT IS PDF REMEDIATION?

**PDF Remediation** involves labeling advanced components of PDF files to make them accessible to users who rely on assistive technology. This process ensures that individuals with disabilities can access and understand the content of the PDF documents.

Once more, these “labels” distinguish the components and illuminate the assistive innovation about the request wherein they are intended to be perused. Numerous associations utilize the PDF record design on the grounds that outwardly, it continues as before, regardless of what stage is utilized to open it.

Preferably, all records would be made accessible, and remain as such regardless of whether “saved as PDF.” In truth, that is many times, not the situation. Indeed, even totally open reports made in MS Word, Google Docs, or other composing apparatuses may not be available when saved to PDF design. Similarly, reports that are initially inaccessible or only partially open will no longer open when you save them as PDF. Remediation is required.

The advantages of adding the right PDF labeling go past openness. Normal PDF components expecting remediation to be made open are pictures, headings, joins, records, tables, and understanding requests.

PDF remediation works on “tags”. Tags are digital labels of information used to give assistive technology about the elements contained in a document. It can include images, headings, tables, links, and more. Tags tell us where these different elements are in the order of the document.

An accessible pdf means that it allows people with vision impairments and disabilities to access and read it. PDF doesn't happen organically.
